

Device Series 7xxx-AB...

The 7xxx-AB unit series has been developed for glass storage areas. These vacuum lifting units can be used to move vertically stored plate material, while keeping its surface stable.

The carrying pipe can be extended for this unit family, so that suction cup separation can be matched to the material being carried. The modular construction of the unit means that its vacuum generation can always be matched to actual requirements.

Simple changing over of the vacuum unit means that a mains powered Kombi 7001-xx can be converted to a battery powered Kombi 7011-xx.

All units can be supplied with protection gratings and adjustable supports for freshly sealed insulating glass units.

The units in version 2 of this series are able, during support of the lower edge of the transported plate, to lower it onto a surface, e.g. onto a table, or to lift it from such a surface.

We also supply our unit range with twin circuit technology. Customized products pose no problem.

Take advantage of the experience we've gained in the production and application of vacuum lifting units since 1965.
