

Device Series 7xxx-A...

The 7xxx-A unit series has been developed for glass storage areas and building sites. These vacuum lifting units can be used to move vertically stored plate material.

Spacing between suction cups is matched to the material to be transported. The suction cups are displaceably mounted on the carrying pipe.

The modular construction of the 7xxx-A-1000 unit series means that the unit vacuum generation can always be matched to actual requirements. Simple changing over of the vacuum units means that a mains powered Kombi 7001-A-1000 can be converted to a battery powered Kombi 7011-A-1000.

All units can be supplied with protection gratings and adjustable supports for freshly sealed insulating glass units.

All units can be supplied with protection gratings and adjustable supports for freshly sealed insulating glass units.

We also supply our unit range with twin circuit technology. Customized products pose no problem.

Take advantage of the experience we've gained in the production and application of vacuum lifting units since 1965.
